1.

Given the architecture and terminology we introduced in Chapter 1, where are files stored?

- ○ Motherboard
- ○ Central Processor
- ● Main Memory
- ○ Secondary memory

2.

What is stored in a "file handle" that is returned from a successful **open() call?**

- ○ The handle has a list of all of the files in a particular folder on the hard drive
- ● All the data from the file is read into memory and stored in the handle
- ○ The handle is a connection to the file's data
- ○ The handle contains the first 10 lines of a file

3.

What do we use the second parameter of the **open() call to indicate?**

- ○ How large we expect the file to be
- ● Whether we want to read data from the file or write data to the file
- ○ The list of folders to be searched to find the file we want to open
- ○ What disk drive the file is stored on

5.

What is the purpose of the newline character in text files?

○ It allows us to open more than one files and read them in a synchronized manner

○ It adds a new network connection to retrieve files from the network

○ It enables random movement throughout the file

⦿ It indicates the end of one line of text and the beginning of another line of text

---

| point |

6.

If we open a file as follows:

```
1  xfile = open('mbox.txt')
```

What statement would we use to read the file one line at a time?

○
```
1  READ xfile INTO LINE
```

○
```
1  while (<xfile>) {
```

⦿
```
1  for line in xfile:
```

○
```
1  while ((line = xfile.readLine()) != null) {
```

Chapter 7 Quiz

7.

What is the purpose of the following Python code?

```
1   fhand = open('mbox.txt')
2   x = 0
3   for line in fhand:
4           x = x + 1
5   print(x)
```

○ Remove the leading and trailing spaces from each line in mbox.txt

○ Reverse the order of the lines in mbox.txt

○ Convert the lines in mbox.txt to upper case

● Count the lines in the file 'mbox.txt'

---

1 point

8.

If you write a Python program to read a text file and you see extra blank lines in the output that are not present in the file input as shown below, what Python string function will likely solve the problem?

```
1   From: stephen.marquard@uct.ac.za
2
3   From: louis@media.berkeley.edu
4
5   From: zqian@umich.edu
6
7   From: rjlowe@iupui.edu
8
9   ...
```

○ ljust()

● rstrip()

○ split()

○ trim()

---

1 point

9.

The following code sequence fails with a traceback when the user enters a file that does not exist. How would you avoid the traceback and make it so you could print out your own error message when a bad file name was entered?

```
1   fname = input('Enter the file name: ')
2   fhand = open(fname)
```

○ setjmp / longjmp

● try / except

○

○ begin / rescue / end

Chapter 7 Quiz ○ on error resume next

Quiz, 10 questions

point

10.
What does the following Python code do?

```
1   fhand = open('mbox-short.txt')
2   inp = fhand.read()
```

○ Turns the text in the file into a graphic image like a PNG or JPG

○ Prompts the user for a file name

⦿ Reads the entire file into the variable **inp** as a string

○ Checks to see if the file exists and can be written
